

# Guidelines

[A] Use FRAX if using NOGG or Kanis et al 2020<sup>4</sup> nomograms to decide risk level. QFracture is not calibrated for these tools and decisions on treatment should be based on the BMD measurement.

[B] Imminent risk refers to a clinical setting in which a fracture has occurred within the previous 2 years.

[C] In some instances, denosumab also has to be initiated by secondary care.

[D] Prescribers should refer to the individual summaries of product characteristics.

IV=intravenous; MHT=menopausal hormone therapy; NOGG=National Osteoporosis Guideline Group
